Can battery energy storage systems be used in solar power plants?

However, the mismatch between solar production curves and load consumption patterns can make this difficult. One of the most effective and increasingly popular solutions is integrating Battery Energy Storage Systems (BESS) with your solar PV installation. But when exactly is BESS used in solar power plants and how does it work in practice?

What are battery storage systems?

Battery storage systems will play an increasingly pivotal role between green energy supplies and responding to electricity demands. Battery storage, or battery energy storage systems (BESS), are devices that enable energy from renewables, like solar and wind, to be stored and then released when the power is needed most.

Do you need a battery energy storage system?

Conversely, electrical energy storage generally requires a battery energy storage system (BESS). Specifically, utility-scale battery systems typically show storage capacities ranging from a few to hundreds of megawatt-hours.

How does a battery storage system work?

A battery storage system can be charged by electricity generated from renewable energy, like wind and solar power. Intelligent battery software uses algorithms to coordinate energy production and computerised control systems are used to decide when to store energy or to release it to the grid.
