What is the difference between charging pile and charging station?

Although "charging pile" and "charging station" are occasionally used interchangeably, they describe different ideas. A charging pile is the basic component of an electric power infrastructure that allows electricity to flow to the vehicle.

What is a charging pile?

A charging pile is the basic component of an electric power infrastructure that allows electricity to flow to the vehicle. The charging station is a more generic word that can refer to one or more charging piles in a particular place, usually equipped with additional facilities such as parking lots, lighting, and payment terminals.

What are the different types of charging piles?

Charging piles are mainly divided into AC charging piles and DC charging piles. AC charging piles have a smaller body, are flexible for installation, and typically take 6-8 hours to fully charge. They are suitable for small electric vehicles and are commonly used in public parking lots, large shopping centers, and community garages.

What is an EV charging pile?

An EV charger or charging pile is a unit intended for supplying electric energy to an electric vehicle that requires charging in order to increase its stored energy. They act as intermediaries between the power grid and an electric vehicle (EV), controlling the current and voltage supply to ensure that charging is done efficiently and safely.
