Are AC & 400V DC rack power distribution scalable in AI data centers?

As AI workloads continue to drive up data center power demands, both AC and 400V DC rack power distribution present compelling solutions for improving efficiency and scalability. While AC infrastructure remains dominant, its inefficiencies are becoming more apparent, particularly in high-power-density AI data centers.

Why do data centers use AC power?

AC power remains the dominant method of power distribution in data centers due to existing infrastructure and standardization. (Figure 1) However, as AI workloads drive unprecedented energy consumption, the inefficiencies of AC power systems become increasingly evident.

Why are data centers adopting 400V DC rack power distribution?

Data centers are increasingly adopting 400V DC rack power distribution as an alternative to traditional AC systems, driven by the need for improved efficiency, reliability and cost-effectiveness.

How does the AC charging station work?

The AC charging station only provides power output and does not have charge inducted to an on-board charger to charge electric vehicles. Low power (7kw, 22kw, 40kw) The charging logic block actually suppresses the controller PCB and transfers the main power supply to the integrated graphics card charger. The AC charging station fully controls
