What is the difference between flow batteries and lithium ion batteries?

Compared to lithium-ion batteries, flow batteries offer superior scalability due to their ability to easily increase energy capacity by adding more electrolytes to the tanks. Lithium-ion batteries, on the other hand, have limited scalability, as their capacity is primarily determined by the number of cells in the battery pack.

Why do flow batteries have a low energy density?

Flow batteries, while offering advantages in terms of decoupled power and energy capacity, suffer from lower energy density due to limitations in the solubility of active materials and electrode capacity. The broad voltage windows of non-aqueous electrolytes in flow batteries can also impact their energy density.

Do lithium ion batteries deteriorate?

In contrast, most prevalent lithium-ion batteries are known to suffer from degradation mechanisms such as lithium plating, growth of passivated surface film layers on electrodes, and loss of recyclable lithium ions and electrode material, all of which adversely affect their longevity.

How long do lithium ion batteries last?

Traditional batteries like lead-acid and lithium-ion ones, on the other hand, can experience a decreased lifespan and reduced performance if they are frequently deeply discharged. For lithium-ion batteries, you can expect them to last no more than 10 years. But for flow batteries, some can last up to 30 years.
