Can storage be used as a transmission asset?

Using storage as a transmission asset, or SATA, can yield savings for consumers and limit the impacts on land resources and the environment, said the study by the New York Battery and Energy Storage Technology Consortium, or NY-BEST, in partnership with Quanta Technology.

How have energy storage costs changed over the past decade?

Trends in energy storage costs have evolved significantly over the past decade. These changes are influenced by advancements in battery technology and shifts within the energy market driven by changing energy priorities.

Is energy storage a cost-effective alternative to traditional transmission lines?

Energy storage is a cost-effective alternative to traditional transmission lines for integrating renewable energy, maintaining reliability and modernizing the electric grid, according to a recent study.

Can energy storage avoid overbuilding new transmission lines?

"While energy storage cannot completely obviate the need for all new transmission lines, as our study shows, there are several cases where using energy storage as a transmission asset can avoid overbuilding new transmission lines and greatly reduce the potential impact on New York ratepayers," said William Acker, executive director of NY-BEST.

Energy storage should be considered and treated as transmission assets and not limited only to proposal as a "non-transmission alternative" or similar construct.

In this study, we establish a value assessment and optimal operation model of grid-side energy storage to explore the rationality of incorporating grid ...

This will greatly increase the transmission and transportation logistics cost of energy storage system, which is not considered in the traditional energy storage cost model ...

As a transmission asset, the storage system's costs will be recovered through MISO's FERC-approved transmission system rates, and it will not participate in energy markets

New research finds that transmission costs must be at least \$600/MW-km and energy storage must cost at most \$100/kW h in order for wind energy storage to be economical.

More transmission lines would allow the connection of more solar power, wind power and energy storage to the electric grid. In turn, ...
